

## Sun\_stop (working title)

The Sun is projecting in the same spot of the sky (for instance just little bit before the sun set). For the realization of those projection are necessary to set the cameras around the globe (on the different time zones) in a way that approximately each hour its possible to switch from one camera to another in order to " **keep the sun in the same spot**". (only the names of geographical location will be constantly changing on the projection) Projecting can be realized with the help of the internet.

*\*Dedicated to A. L. Chizevsky, Russian scientist and thinker, born 7th February 1897 and today known as founder of Geleobyology, the scientist that first started of to elaborate the dependence of all living processes on Earth, biological and social, from the activity of the Sun.*
